Motorola Sales Performance & Customer Insights – Dashboard Report

-Gaurav Kumar

Executive summary

The dashboard covers 3,835 transactions from 9 Oct 2021 to 8 Oct 2024 and records 769.2M in sales (currency assumed INR) on 19,150 units. Sales are evenly spread across brands, concentrated in two cities, flat to slightly down year on year, and customer ratings have fallen every year.

1. **Brands are closely matched.** Apple leads with 161.6M (21.0%) and Xiaomi trails with 143.8M (18.7%); all five brands sit within a 2.3-point band.
2. **Two cities carry 43% of sales.** Delhi (203.9M, 26.5%) and Mumbai (127.2M, 16.5%); the other 17 cities hold 3.0–4.0% each.
3. **Growth has stalled.** Sales fell 3.3% from 2022 (262.0M) to 2023 (253.3M). On a like-for-like Jan–Sep basis, 2024 is 188.8M, down 0.8% on 2023.
4. **Satisfaction is declining.** Average rating dropped from 3.96 (2022) to 3.51 (2023) and 3.41 (2024); 22.2% of all transactions are rated 1 or 2 stars.
5. **The dashboard needs fixing before it is shared.** It is titled and branded Motorola, but the data contains no Motorola sales, and a few visuals do not reconcile with the data file (see Dashboard review).

Dashboard overview and data scope

The dashboard is a single page built on one table, `Sales_Data` (3,835 rows, 12 columns, no missing values, no duplicate transactions). Four DAX measures drive every visual: Total Sales (units sold × price per unit), Total Quantity, Transactions (row count) and Average (mean price per unit).

Metric	Value
Total sales	769.2M
Units sold	19,150
Transactions	3,835
Average price per unit	40,114
Average order value	200,575
Average units per transaction	5.0
Unique customers	988 (3.9 transactions each)
Average customer rating	3.69 / 5
Coverage	5 brands, 15 models, 19 cities, 4 payment methods

The KPI cards in the screenshots (769M, 19K, 4K, 40K) carry no labels; they correspond to total sales, units sold, transactions and average price. October 2024 is a partial month (data ends 8 Oct), so it is excluded from all trend comparisons below.

Brand and model performance

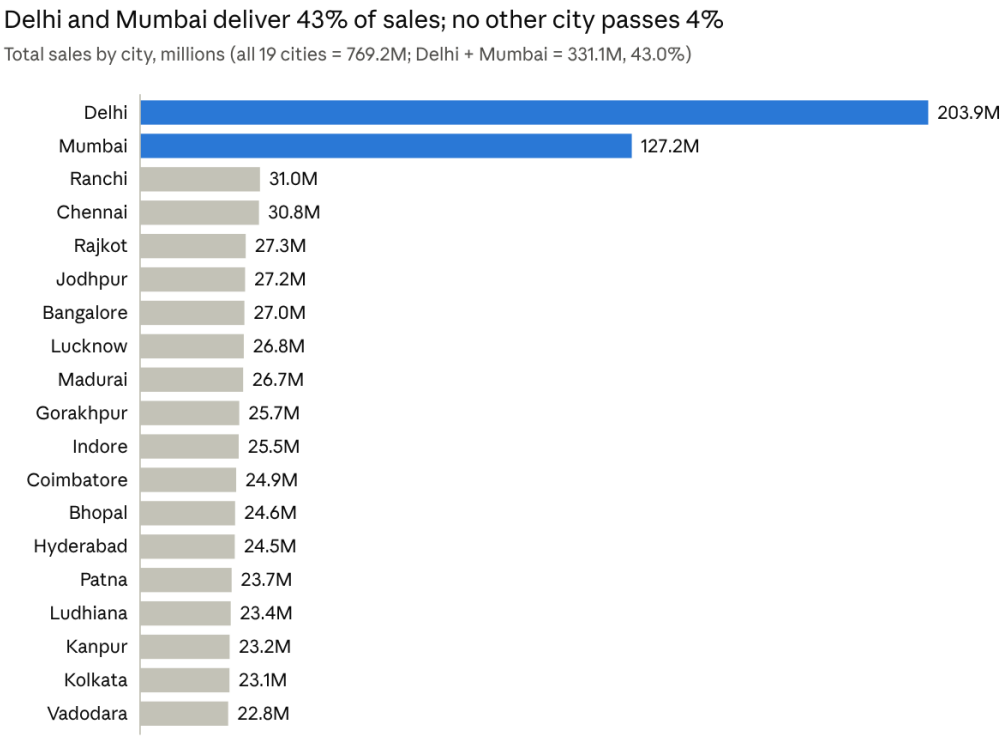

Apple and Samsung lead by volume, not by price: average price per unit is nearly identical across brands (39.4K–41.0K), so the 12% gap between Apple and Xiaomi comes from units sold (3,932 vs 3,664).

Brand	Sales (M)	Share	Units	Transactions	Avg rating
Apple	161.6	21.0%	3,932	783	3.71
Samsung	160.0	20.8%	3,923	775	3.70
OnePlus	153.7	20.0%	3,830	768	3.68
Vivo	150.1	19.5%	3,801	766	3.65
Xiaomi	143.8	18.7%	3,664	743	3.72

- **Top models:** iPhone SE 59.6M (7.7% of sales), OnePlus Nord 57.9M, Galaxy Note 20 56.0M.
- **Bottom models:** Redmi 9 44.7M, Vivo S1 45.5M, OnePlus 9 46.5M. The best model sells 33% more than the weakest.
- **Xiaomi** has no model above 49.6M; its best seller (Mi 11) ranks 10th of 15.
- **Momentum is shifting.** From 2022 to 2023, OnePlus grew about 13% (49.4M to 55.8M) while Xiaomi fell about 17% (54.1M to 45.1M) and Apple about 14% (57.3M to 49.4M).

Geography

Delhi and Mumbai deliver 43% of sales (331.1M of 769.2M); the other 17 cities hold 3.0–4.0% each.

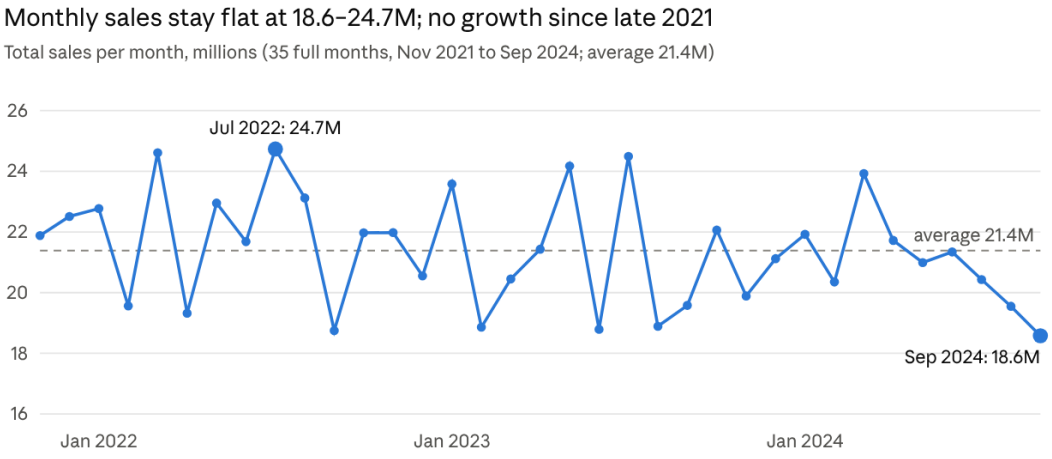

Sales_Data table, Power BI file · 9 Oct 2021 to 8 Oct 2024

Delhi also has the most transactions (1,008) and a 3.75 average rating. Chennai ranks fourth on sales but has the highest order value (246K per transaction against 200.6K overall).

Sales trend and seasonality

Sales have moved sideways: 2023 (253.3M) was 3.3% below 2022 (262.0M), and Jan–Sep 2024 (188.8M) is 0.8% below the same months of 2023 (190.2M).

Sales_Data table, Power BI file · Oct 2021 and Oct 2024 excluded as partial months

- **Strongest calendar months** (three years combined): July 69.6M and March 69.0M.
- **Weakest:** September 56.9M and February 58.8M, about 18% below July.
- **Partial data:** October 2021 starts on the 9th (14.4M) and October 2024 ends on the 8th (6.3M); both are left out of the chart.

Customer ratings

Average rating has fallen every year, from 3.96 in 2022 to 3.51 in 2023 and 3.41 in 2024, and the drop appears in all five brands. That points to a company-wide cause rather than one weak product line; the data cannot say which cause.

Year	All brands	Apple	OnePlus	Samsung	Vivo	Xiaomi
2021 (Oct–Dec)	4.28	4.24	4.41	4.28	4.44	4.03
2022	3.96	3.96	3.85	4.02	3.97	3.99
2023	3.51	3.50	3.50	3.52	3.40	3.61
2024 (to 8 Oct)	3.41	3.48	3.51	3.38	3.35	3.37

- **Distribution:** 5 stars 38.8% of transactions, 4 stars 22.0%, 3 stars 17.0%, 2 stars 14.2%, 1 star 8.1%. Low ratings (1–2 stars) total 22.2%.
- **By brand:** Vivo has the highest low-rating share (24.9%) and Xiaomi the lowest (19.9%).
- **By city:** Hyderabad (3.57), Coimbatore (3.59) and Kolkata (3.60) rate lowest; Indore (3.85) and Vadodara (3.80) rate highest. Mumbai, the second-largest city, sits at 3.62 against Delhi's 3.75.
- **Price is not the driver.** Average price per unit is 39.2K–41.2K at every rating level, so unhappy customers did not pay more or less than happy ones.

The 2021 row covers only three months (296 transactions) and should be read as indicative.

Payment method, weekday and customer age

None of these three dimensions shows a strong skew: every payment method, weekday and age group stays within a few points of an even split.

Payment method	Sales (M)	Share of sales	Transactions
UPI	201.7	26.2%	1,011
Debit card	195.7	25.4%	948
Credit card	186.7	24.3%	947
Cash	185.1	24.1%	929

- **Payments:** UPI is the most used method, and digital methods (UPI plus both cards) account for 75.9% of sales. Cash still carries 24.1%.

- **Weekday:** Saturday is the strongest day (114.6M, 14.9%) and Wednesday the weakest (104.9M, 13.6%). The gap between best and worst day is 9%.
- **Age:** the 46–59 band holds the largest share (32.4%, 249.5M) only because it spans 14 years of age. Per year of age, sales are almost flat across bands (17.8M to 18.9M), so no age group is over- or under-served.

In short, the data gives no segment that stands out for targeting; differences come from city and brand momentum instead.

Dashboard review: data and design issues

The headline numbers are reliable: total sales (769.2M), units (19,150), transactions (3,835), the brand table, the October view (64.7M, 1,577 units, 322 transactions) and the OnePlus view (153.7M, 3,830 units, 768 transactions) all match the Excel source and the data model. The issues below should be fixed before the dashboard is shared.

#	Area	Finding	Suggested fix
1	Branding	Title and logo say Motorola, but the data holds only Apple, Samsung, OnePlus, Vivo and Xiaomi. No Motorola sales exist.	Retitle as a market-wide dashboard, or load Motorola data and add it as a brand.
2	Reconciliation	With Mi 11 selected, the cards show 16.1M, 416 units and 84 transactions. The Excel source and data model give 49.6M, 1,285 units and 263 transactions.	Check for a hidden visual-, page- or report-level filter on this view.
3	Reconciliation	The Customer Ratings funnel totals 836 in the unfiltered view and 84 in the October view, against 3,835 and 322 transactions. The OnePlus view (768) is correct.	Check for a stale cross-filter or a different measure on this visual.
4	Reconciliation	The unfiltered payment pie shows Cash at 22.97%; by transaction count it is 24.22% (UPI 26.56% vs 26.36%).	Confirm the measure behind the pie and re-test after fixing #3.
5	Data quality	Unit price runs from about 10K to 70K for every brand, so the same brand sells at very different prices per unit. Price does not follow model.	Confirm with the data owner what Price Per Unit represents before using revenue for pricing decisions.
6	Data quality	23 rows in the raw Excel use short day names (Wed, Sun, Thu) instead of full names. The data model shows clean values.	Keep the cleaning step in Power Query and document it.
7	Labels	The four KPI cards have icons but no titles;	Add titles: Total Sales,

#	Area	Finding	Suggested fix
		the 40K card (average price) is ambiguous.	Units Sold, Transactions, Avg Price.
8	Time view	Total Quantity by Month stacks three years into twelve months, and there is no Year slicer. October 2024 is partial.	Add a Year slicer and a year-over-year line.
9	Chart choice	The 4-slice payment pie is hard to read (slices of 24–26%). Day-of-week is sorted by value, not weekday. Sales by Mobile Model shows only three of 15 bars.	Use a sorted bar for payments, Monday-to-Sunday order, and a scrollable or top-N model chart.
10	Map	City labels overlap around Delhi, Lucknow and Mumbai.	Show top cities only, with a table of the rest.

Sheet2 of the Excel file lists 30 Indian cities, but only 19 appear in the sales data; the dashboard does not use it.

Recommendations and next steps

Fix the ratings decline first, then reduce dependence on two cities, then correct the dashboard so its numbers can be trusted.

1. **Make ratings a tracked KPI.** Add average rating by month with a target (for example, back to 3.9, the 2022 level) and review Vivo (24.9% low ratings) and the lowest-rated cities (Hyderabad, Coimbatore, Kolkata, Mumbai) first. A short customer survey on the 1–2 star transactions would show the cause.
2. **Reduce dependence on Delhi and Mumbai (43% of sales).** Bangalore, Hyderabad and Kolkata each hold only 3.0–3.5% of sales. The Sheet2 city list also names 11 cities with no sales at all, including Pune, Ahmedabad, Jaipur and Surat; confirm whether these are target markets.
3. **Respond to brand momentum.** Xiaomi (about -17%) and Apple (about -14%) lost the most from 2022 to 2023 while OnePlus grew about 13%. Review pricing, stock and promotions on the Xiaomi range, whose best model ranks only 10th.
4. **Plan around seasonality.** July (69.6M) and March (69.0M) are the strongest months; September (56.9M) and February (58.8M) are the weakest. Schedule promotions for the two low months.
5. **Use average order value by city.** Chennai leads at 246K per transaction against 200.6K overall, while Kolkata (179K), Hyderabad (178K) and Kanpur (185K) trail. Premium models could be pushed in Chennai and bundles tested in the low-AOV cities.
6. **Correct the dashboard before sharing.** Resolve findings 1–4 in the review table, add titles to the KPI cards, add a Year slicer and a year-over-year view.

Data period: 9 Oct 2021 to 8 Oct 2024. Sources: `Sales_Data` table of the Power BI file and the Mobile Sales Data Excel file (3,835 rows, identical values); the four dashboard screenshots were used to check filtered views. Currency is assumed to be INR.
